"SMART SUMMARIES and AUTOMATED ABSTRACTS"
DBI Technologies Inc. Releases EXTRACTOR 7.2

To quote John C. Dvorak (PC Magazine) " …I'm still waiting for this miracle software." He was speaking to the numerous meetings he has had over a ten or eleven year period in which people were telling him about their revolutionary new parsing and automatic abstracting software that for some reason never materialized. Well John C. Dvorak, if you know a reasonably gifted software developer we have the Engine that will make your vision / wish come true. All the software developer has to do is build a user interface that you like and that which will allow you to access the "Engine's" internal features and functions. The features and functions are ready to be tapped into via the 26 application programming interfaces (API's) included with the EXTRACTOR 7.2 product.

EXTRACTOR is a patented (Canada and United States) technology ready to be consumed by C, Java, Perl, Python and Visual Basic software developers. Out of the "box" EXTRACTOR runs on Windows, Linux and Solaris operating systems and best of all EXTRACTOR dynamically handles six international languages (English, French, German, Japanese, Korean and Spanish).

EXTRACTOR is an automated text extraction and text summarization technology providing its consumer and ultimately the end user to have text, emails and/or HTML documents (read web pages for instance) automatically summarized with the option of having the summaries highlighted within the originating document or listed by importance. EXTRACTOR makes the best of your research time without the need to retrain for new domains and allowing you to tune your results using Stop and GoTo word functionality.
